

ESSENCE OF THE PROJECT

The project is trying to eliminate outsourcing manufacturing costs by providing startups a manufacturing alternative in their countries (starting in the USA).

-The Lab (as the first prototype factory will be called) will offer startups state of the art manufacturing technics enrolling A.I., Robotics and Distributed ledger technologies in order to create far more efficient production chain by reducing recalls from an industry average of 20% down to 1%. The partnership with startups does not limit to manufacturing, the clients will have the ability to outsource their Administration, Logistics, marketing etc.

The Lab is their focus and the flagship of the project.

-Another income stream is the ability given to established industry players to replicate the efficient process of the Lab. The factory will serve as demonstration of the technology's abilities.

-Lastly, they will offer the ability to established players for vertical industry sell offs. Meaning exclusivity in manufacturing with the lab's processes in a given industry.

Blockchain will be used as a transparency and security vehicle for the logistics of the project. It is also stated that they want to be able to leverage the technology as a liquidity provider via partnership or third party. Example: At Nexo you can offer crypto as collateral and get a fiat credit line from those crypto assets.

The Project also wants too incorporate DApps and oracle technology. From the WP:

"DApps development and incubation, is going to be a vital component in the Ophelius Labs ecosystem. Along with Oracles, we plan to develop a comprehensive and dynamic ecosystem servicing all aspects of a company's needs. For example: Human Resources, Purchasing, Shipping, Receiving, AP/AR, Assembly Line, so on and so forth."
